Digitalization of photoarchives in Estonian Film Archives

Ivi Tomingas
18.04.2008 Riga
The beginning: 2001 in cooperation with OÜ Reprokeskus they scanned 1000 photos.
Scanning in archive

- 2002 we bought flatbed scanner
- First we started to scan for customers
- 2003 we worked out our main principles
- 2004 we started to scan with metadata
- 2007 we have some 25,000 digital images
- Still we have no solution for digital preservation
Main principles: digital image is serving as a usage copy, not a safety copy.
That's why:

- Resolution for 35mm b/w neg and b/w positive 10X15 600dpi
- The depth 8bit Greyscale, 24 bit RGB
- 35mm neg 900x600, pos 2400X3000
- 5-8MG
How to choose: physical condition, historical value, customers request, copyright
Future:digital preservation, database
Thank You
