# -1. Lets make a poll!

- Please answer truthfully by raising your hands:
  - 1. Who believes in **free lunches**?
  - 2. Who believes in **miracles**?
  - 3. Who believes everything must be **digitized**?
  - 4. Who believes everything can be turned into **bits** (and pieces)?
  - 5. Who has seen a proper **OCR (optical character recognition)** done in an automated fashion?

# o. take the **FREE LUNCH!**

- If somebody wants to offer you a free lunch, take it!
  - 2012 BAAC conference excursion to the Finnish Broadcasting Company (Yleisradio, **YLE**)

Library cabinets full of cardboards – YLE vinyl record archives

# 0+1. I said: take the FREE LUNCH!

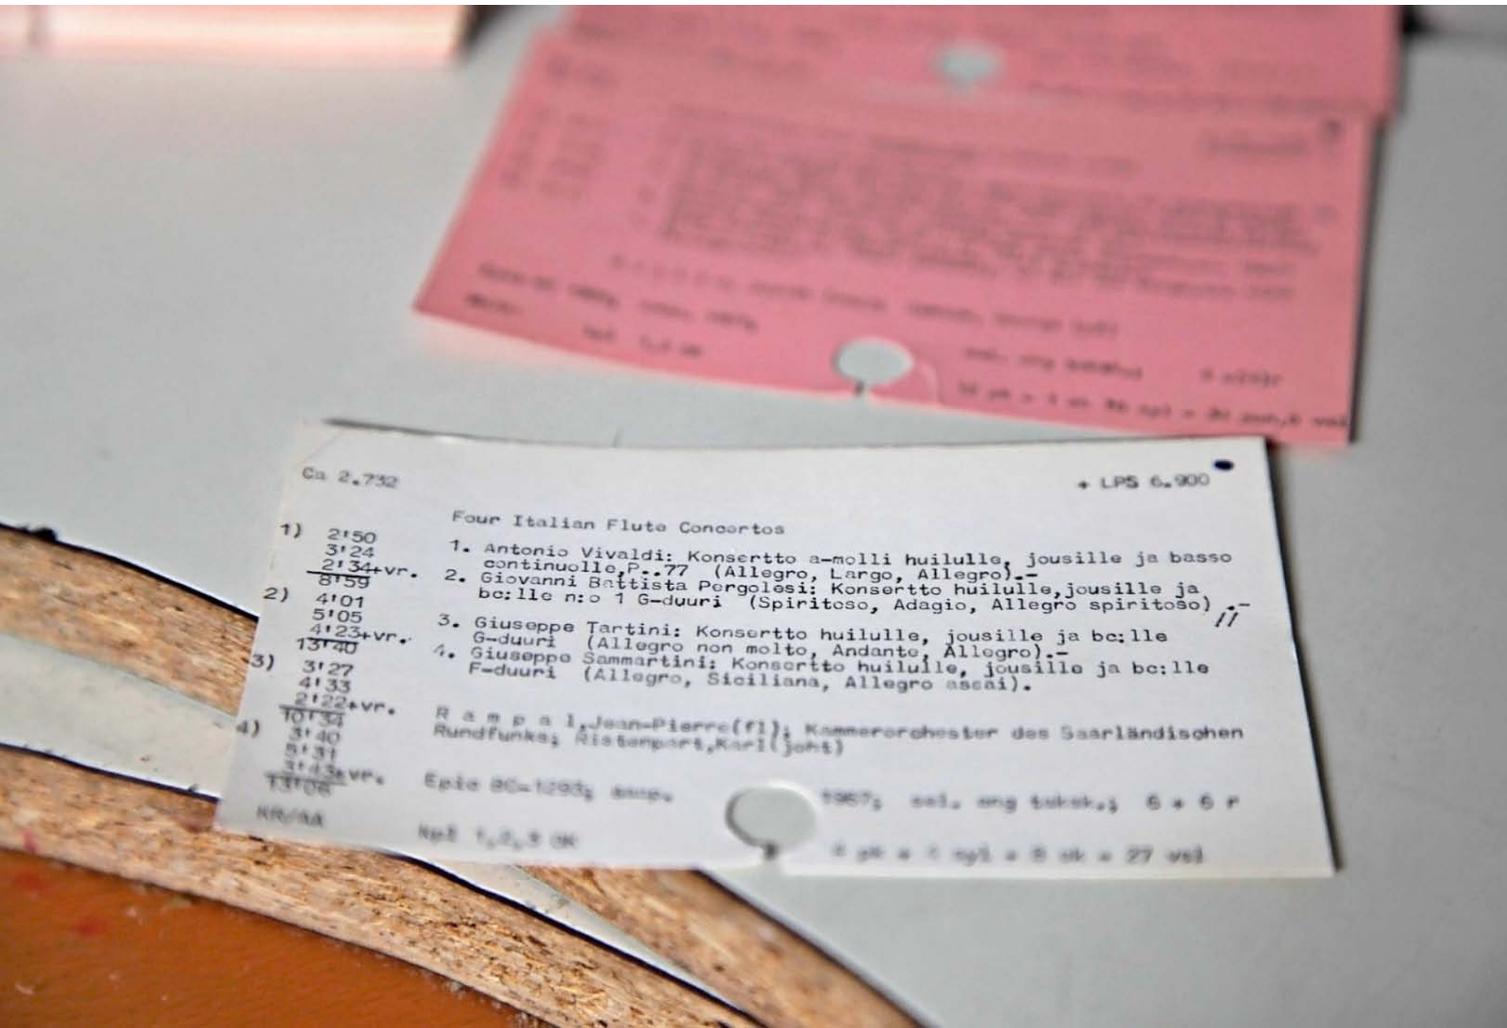

- If somebody wants to offer you a free lunch, take it!
  - We have 37 000 cardboards from our vinyl archives, ca. 1966 – 1973. Care to scan & **OCR** them, as nobody else cannot do it?

They are, of course, all different (as such a computer would regard them)!

# 1. What do you want?

- What the customer wants?
  - Customer's initial specification

1. Take all the data out of the printed card
2. Turn the data into information in XML format (for YLE's METRO database system) = structured information

# 2. What do you need?

- What the customer wants and (definitely) needs are not the same thing!
  - Do you really need all the data (even the obsolete, e.g. archive writer initials)

What are your minimum demands?

# 3.YLE OCR case: make a pilot!

- The entrepreneur takes all the risks (bah!), so take the first 100 cards, scan & OCR them as a pilot!
  - But first, clean and tweak your machines

My benefit is your benefit and your  
my benefit!

# 4.YLE OCR case: make a test pilot!

- Testing one-two-three; alfa, beta, gamma; o-series – when does this “pilot” actually start?

- Scanning in 400 dpi (1:1), black-and-white uncompressed TIFs

# 4.YLE OCR case: scanning

- Production scanning – show [video](#) or [photos](#)

# 5. Optical character recognition (OCR)

- What is OCR?
- How does it work?
- How well does it work?
- How much does it cost?
- OCR – many readymade (and less ready) solutions
  - Tesseract (open source, from HP originally)
  - *Abby Finereader* (many versions, also server-based)
  - Omnireader
  - Others..

# 5. Seeing is believing

## ■ What is the real problem here?

# 0+1. I said: take the FREE LUNCH!

- If somebody wants to offer you a free lunch, take it!
  - We have 37 000 cardboards from our vinyl archives, ca. 1966 – 1973. Care to scan & **OCR** them, as nobody else cannot do it?

They are, of course, all different (as such a computer would regard them)!

# 5. Seeing is believing

- Even without extensive knowledge about OCR, one can understand that **OCR itself should not be the biggest problem**
- *Machine written text* (special typewriter types of machines; 2 or 3 machines making slightly different typeface)
  - the OCR should not be the major bottleneck, at least when using **well-trained** (to the actual cards) & **able OCR software**

# 5. Seeing is believing

- OCR will **always** have problems that are inherent to the originals
  - Some of the cards are pressed each other and/or otherwise worn (*bad condition originals*)
    - the OCR will make random mistakes there, no doubt about it (but their total amount is relatively small)
  - Some of the cards include *machine and/or hand-made corrections* (e.g., double strikes; *hand-written originals*)
    - the OCR will make mistakes there, no doubt about it (but their total amount is small)

# 5. Seeing is believing

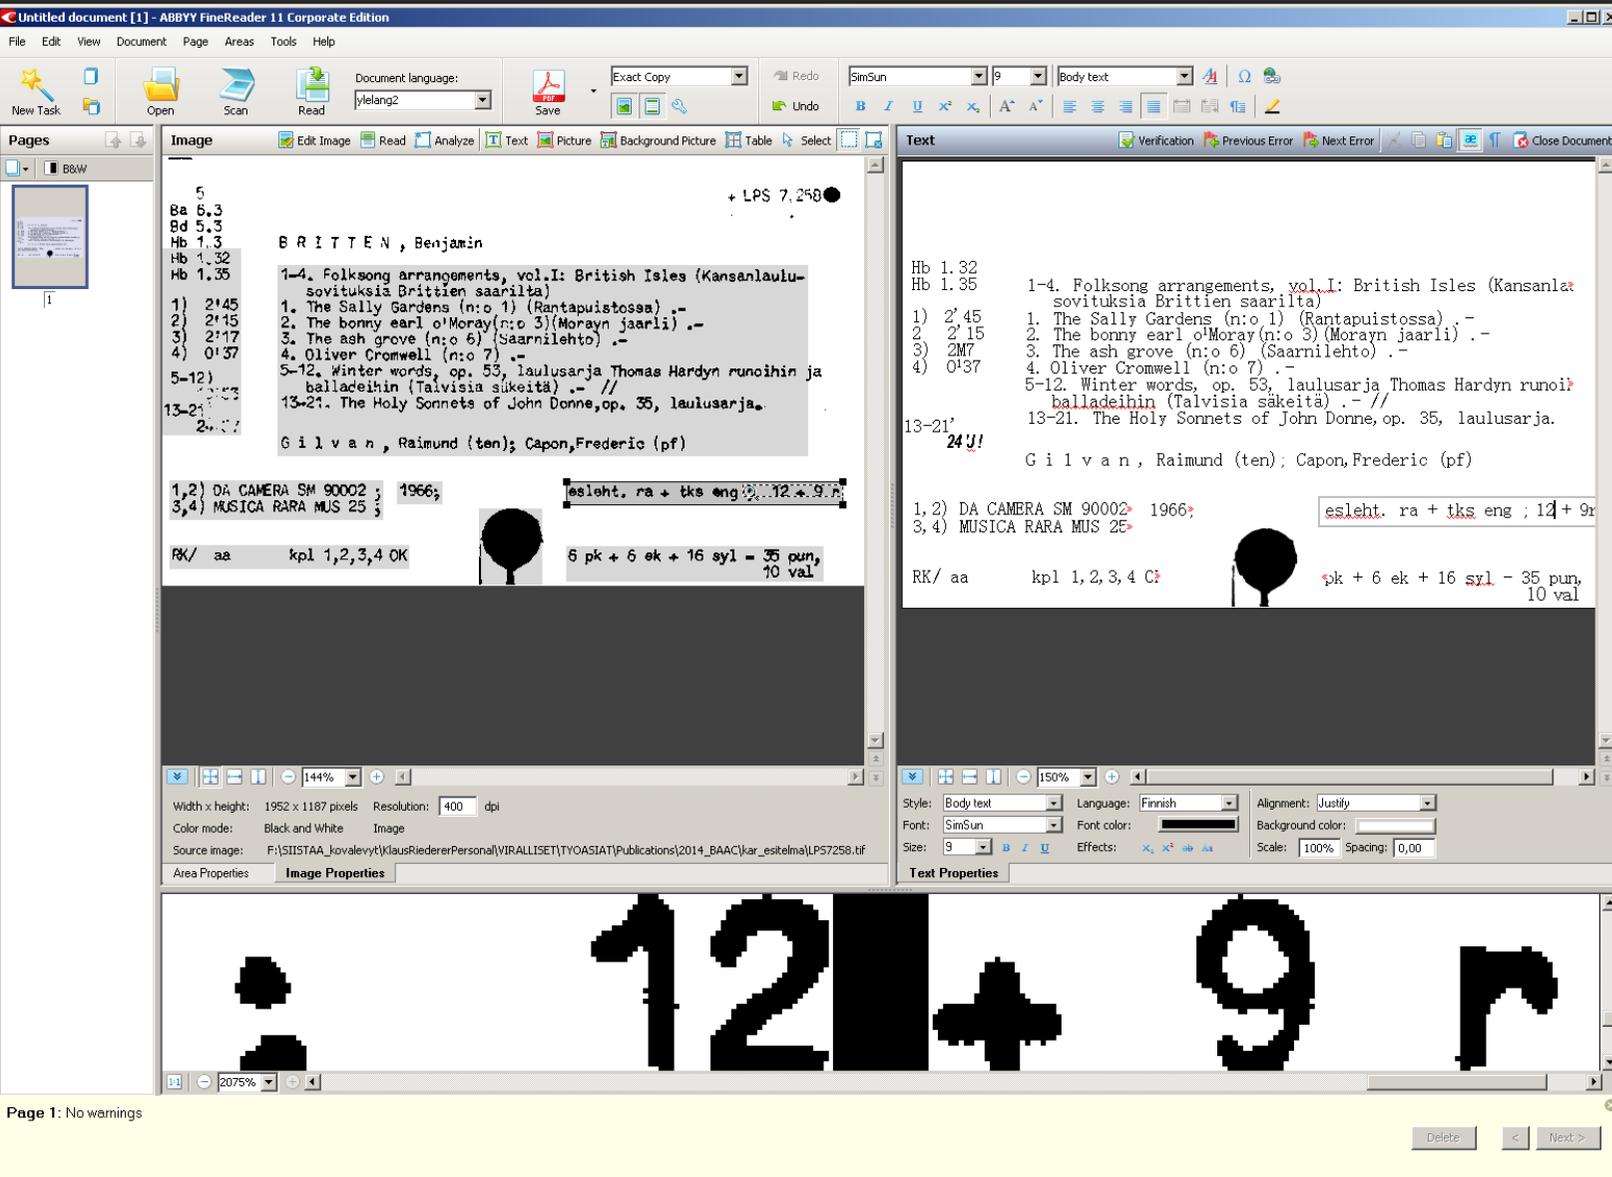

- But the layout in the cards is the PROBLEM
  - The information in the cards overlaps in visible rows , which is  
**A REAL PROBLEM**
  - AND *the variance in the actual layout between the cards is*  
**EVEN MORE SERIOUS DILEMMA**
- *Technical vs. practical problems*

7pk+1ek = 15 pun 4 val

- Do the region splitting manually per card?
  - And split your brains while doing it (37000\*8 = 296 000 regions)?!

# 7. PROBLEM – ~~what~~ how to do?

- Only one (obvious) solution here:
  - split the scanned image into regions and OCR those separately
  - **HOW TO MAKE THIS EFFECTIVELY?**

# 7. KAR Ltd. = problem solver

- KAR Ltd / Klaus A J Riederer, PhD:  
+20 years of coding – now applying also *machine vision* methods
  - Divide the scanned card image into 8 regions, applying deep intelligence *mimicking human cognition*
  - Each card is *processed twice*, both processes use *multiple inter-dependent functioning levels*

# 7. KAR Ltd.'s problem solving

- *The first run applies preset region positions (i.e., **region of interest =ROI**) for machine vision methods*
  - *Computer suggests the most probable region area for the user, based on numerous boundary conditions and preset rules*
  - *The machine vision methods and its conditions and rules are fine-tuned very carefully, separately for each region in question*

# 7. KAR Ltd.'s problem solving

- *In the second run the user verifies and accepts or changes the region positions from the first run, because:*
  - *The computer "learns" from the user's response so that following regions' positions depend on the previous regions' positions ( $\leq$  regions may not overlap!)*
    - *This utilization of history is made only per current card, as the cards are so varying between each other*
    - *A global learning process is inherent in the coding process: the code has been iteratively improved (until ca. 15000 cards were run)*

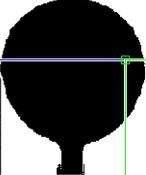

# 7. KAR Ltd.'s problem solving

# 7. KAR Ltd.'s problem solving

- Most basic rules for the regions:
  - All the regions are rectangle –shaped
  - The card must have ONLY information from the region #1 (discnro), BUT other region information may be missing (= empty)
  - Some of the region positions do not overlap; but
  - The final region areas may overlap (so that all information is gathered from the cards, in cost of redundancy)

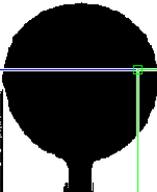

# 7. KAR Ltd.'s problem solving

# 7. KAR Ltd.'s problem solving

- Too much between-card variation for 100 % automation
  - not possible to automate the region splitting process fully.
  - Numerous fine-tuned algorithms in the code -> runtime per card region splitting down to 15 – 30 s

# 7. KAR Ltd.'s problem solving

- Real-time demo of the semi-automated region creation (= cropping the scanned image into 8 subimages for OCR)

# 8. Improving the out-of-box OCR

- Train the OCR (= teach character patterns using the actual scanned documents) or not?

# 9. Training the OCR software with scanned YLE records' index cards

- All first 100 cards (LPS6001-LPS6099) learned per all (desired) characters
- Most of the cards learned several times
- The used typeface ("font") in the cards is very problematic
  - Letters "i" and "l" and number "1" are VERY SIMILAR to each other,
  - Letters "o" and "O" and number "0" are VERY SIMILAR to each other
  - There are many other similarities as well hindering the OCR process!

# 9. Training the OCR software with scanned YLE records' index cards

- Character templates (0-50) \* 89 + **numerous ligatures**, eg.:  
11, 10, ll, lle, ie, ic, io, oc..  
[capitalized: 11, 10, LL, LLE, IE, IC, IO, OC ..]
- In total **ca. 4000 specially taught patterns** + built-in patterns used the OCR software.

# 9. Training the OCR software with scanned YLE records' index cards

- Scanned image (with regions)

[Show more results](#)

# 10. Making the OCR more effective

- The OCR software (the non-server versions, at least) has plenty of ~~limitations~~ features, e.g.
  - Too many pages (independent of actual size in pixels) cause it to jam (**memory extensive** application)
  - The software cannot use effectively multiple threads (**no multi-CPU support**)
  - The **software hangs** seldomly, but hangs altogether
  - The software sometimes **cannot save its results** (OCRred files), causing a hang on the process
  - The software has **no shell support** for effective scripting (automation)

# 10. Making the OCR more effective

- The OCR software manufacturer has multiple versions of its software, including server based applications, but
  - with an additional price per OCRred page)

# 10. Making the OCR more effective

- To smooth the OCR process
  - Limit the page count to  $< 100$  (per OCR document)
    - Running typically 9 YLE cards =  $9 * 8 = 72$  pages
  - Do nothing else with your computer when the OCR is running
  - Set a task for OCR software with all options & conditions preset
    - Do not allow preprocessing (when doing automated OCRing)

# 10. Automating the OCR software!

- To automate the OCR process
  - Create automated process, in which the OCR software always goes through the same folder with the same amount of images and have a master program to call it by window handling, mouse clicks and sort out the file handling
- **Show demo**

# 11. Outcome

- OCR software creates txt files that customer will parse further according to their needs
- For consistency checks, KAR Ltd. also parsed the data into Excel (XLS) spread sheet following the following structure:

Region information	1. region			2. region	3. region
Region workname	DISCNRO (~ basename)			CLASS	SONGLEN
Description	stereo/mono	integer	side/ring	mixed codes	length of songs
1. option	<b>+LPS</b>	<b>12345</b>		<b>Abc.123</b>	<b>1) XY'Zz</b>
2. option	<b>+LP</b>		<b>A</b>	(several)	<b>1. XY'Zz</b>
following options			<b>B1</b>		<b>XY'Zz</b>
(Data can be missing)			(yes)	(yes)	(yes)
4. region	5. region	6. region	7. region	8. region	
TITLE	SONGNAME	ARTIST	PUBLISHER	ADDINFO	
Disk title	song names	artist	publisher	additional info	
<b>Disk name</b>	<b>song name</b>	<b>Artist</b>	<b>Record co.</b>	<b>Writers ID</b>	
<b>Composer</b>	<b>song name</b>	<b>composer</b>	(several)	<b>Julkaisukielet</b>	
(several)	(several)	(several)		(several)	
(yes)	(yes)	(yes)	(yes)	(yes)	

This table is split after region 3 for layout reasons.

[See results.](#)

In **bold** and *italics* are typical examples of the OCRred text. Region 1 (DISCNRO) is split into 3 columns, others have only 1 column and may be empty.

# 12. Conclusions

- Digitizing work is straightforward in the game
  - technical problems can always be solved / made a compromise – practical dilemmas are worse
- OCR is a technical matter
  - one must accept (make compromise) that the quality of the originals sets the baseline;
  - 100 % correctness is nowhere (“should typos be corrected”)

# 12. Conclusions

- How does one succeed in making successful optical character recognition (OCR) of scanned documents?
- How does one judge success?
  - Error rate to what?
  - At what cost?
- **A happy customer is the best measure of all – right? 😊**

# 13. Further work

- The work of KAR Ltd. does not stop here
  - More work *has been done already* on scanning and OCRing microfilms (fiches) applying the above methods adjusted to the new work / specifications  
[see here](#)
- KAR Ltd. has just moved to (5 x) bigger location (468 m<sup>2</sup>) with *more machines and playground*  
**WELCOME TO VISIT US AT ANYTIME! 😊**

Klaus A J Riederer, Dr. (tech),  
KAR Ltd, CEO:

**You most likely have not  
learned a thing –  
but hopefully you have at least  
thought of something!**
